Concept of black hole and event horizon

What is a black hole ?

... for the layman:

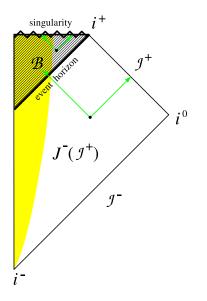

< □ > < ^[] >

A **black hole** is a region of spacetime from which nothing, not even light, can escape.

The (immaterial) boundary between the black hole interior and the rest of the Universe is called the **event horizon**.

[Alain Riazuelo, 2007]

What is a black hole ?

... for the mathematical physicist:

black hole: $\mathcal{B} := \mathcal{M} - J^{-}(\mathscr{I}^{+})$

i.e. the region of spacetime where light rays cannot escape to infinity

- $(\mathcal{M}, \boldsymbol{g}) = \text{asymptotically flat}$ manifold
- $\mathscr{I}^+ = future null infinity$

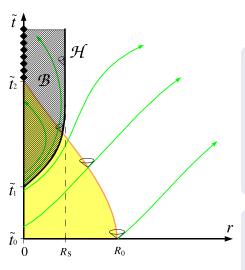

•
$$J^-(\mathscr{I}^+) = \mathsf{causal} \ \mathsf{past} \ \mathsf{of} \ \mathscr{I}^+$$

event horizon: $\mathcal{H} := \partial J^{-}(\mathscr{I}^{+})$ (boundary of $J^{-}(\mathscr{I}^{+})$)

 $\mathcal{H} \text{ smooth} \Longrightarrow \mathcal{H} \text{ null hypersurface}$

Image: A math a math

Concept of black hole and event horizon

What is a black hole ?

... for the astrophysicist: a very deep gravitational potential well

Release of potential gravitational energy by **accretion** on a black hole: up to 42% of the mass-energy mc^2 of accreted matter !

NB: thermonuclear reactions release less than 1% mc^2

Matter falling in a black hole forms an **accretion disk** [Lynden-Bell (1969), Shakura & Sunayev (1973)]

[J.-A. Marck (1996)]

• In general relativity, a black hole contains a region where the spacetime curvature diverges: the singularity (*NB: this is not the primary definition of a black hole*). The singularity is inaccessible to observations, being hidden by the event horizon.

Image: A math a math

- In general relativity, a black hole contains a region where the spacetime curvature diverges: the singularity (*NB: this is not the primary definition of a black hole*). The singularity is inaccessible to observations, being hidden by the event horizon.
- The singularity marks the limit of validity of general relativity: to describe it, a quantum theory of gravitation would be required.

- Viewed by a distant observer, the horizon approach is perceived with an infinite redshift, or equivalently, by an infinite time dilation
- A black hole is not an infinitely dense object: on the contrary it is made of vacuum (except maybe at the singularity); black holes can form in spacetimes empty of any matter, by collapse of gravitational wave packets.

イロト イヨト イヨト イ

Uniqueness theorem

(Dorochkevitch, Novikov & Zeldovitch 1965, Israel 1967, Carter 1971, Hawking 1972) :

A black hole in equilibrium is necessarily a Kerr-Newmann black hole, which is a vacuum solution of Einstein described by only three parameters:

- ullet the total mass M
- ullet the total angular momentum J
- the total electric charge Q
- \implies "a black hole has no hair" (John A. Wheeler)
 - Q = 0 and J = 0: Schwarzschild solution (1916)
 - Q = 0 : Kerr solution (1963)

A D F A A F F

Concept of black hole and event horizon

Main properties of black holes (3/3)

• The mass *M* is not a measure of the "matter amount" inside the black hole, but rather a parameter characterizing the external gravitational field; it is measurable from the orbital period of a test particle in circular orbit around the black hole and far from it *(Kepler's third law)*.

Image: A math a math

Concept of black hole and event horizon

Main properties of black holes (3/3)

- The mass *M* is not a measure of the "matter amount" inside the black hole, but rather a parameter characterizing the external gravitational field; it is measurable from the orbital period of a test particle in circular orbit around the black hole and far from it *(Kepler's third law)*.
- Similarly, the angular momentum J is a parameter characterizing the external gravitational field, more precisely the so-called *gravito-magnetic* part of it. It is measurable from the precession of a gyroscope orbiting the black hole (*Lense-Thirring effect*).

Image: A math a math

- Similarly, the angular momentum J is a parameter characterizing the external gravitational field, more precisely the so-called *gravito-magnetic* part of it. It is measurable from the precession of a gyroscope orbiting the black hole (*Lense-Thirring effect*).
- The radius of a black hole is not a well defined concept: it *does not* correspond to some distance between the black hole "centre" (the singularity) and the event horizon. A well defined quantity is the area of the event horizon, *A*.

The radius can be then defined from it: for a Schwarzschild black hole:

$$R := \sqrt{\frac{A}{4\pi}} = \frac{2GM}{c^2} \simeq 3\left(\frac{M}{M_{\odot}}\right) \, \mathrm{km}$$

 $\bullet\,$ not applicable in ${\bf cosmology},$ for in general $(\mathscr{M}, {\boldsymbol g})$ is not asymptotically flat

・ロト ・回ト ・ ヨト

not applicable in cosmology, for in general (*M*, *g*) is not asymptotically flat
even when applicable, this definition is highly non-local:

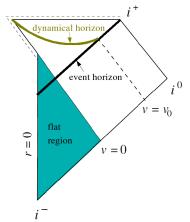

Éric Gourgoulhon (LUTH)

Black hole horizons

・ロト ・回ト ・ ヨト

not applicable in cosmology, for in general (*M*, *g*) is not asymptotically flat
 even when applicable, this definition is highly non-local:

Determination of $\dot{J}^-(\mathscr{I}^+)$ requires the knowledge of the entire future null infinity. Moreover this is not locally linked with the notion of strong gravitational field:

Example of event horizon in a **flat** region of spacetime:

Vaidya metric, describing incoming radiation from infinity:

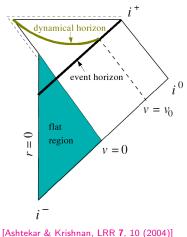

$$ds^2 = -\left(1 - \frac{2m(v)}{r}\right)dv^2 + 2dv \, dr$$
$$+r^2(d\theta^2 + \sin^2\theta d\varphi^2)$$

 $\begin{array}{ll} \mbox{with} & m(v)=0 & \mbox{ for } v<0 \\ & dm/dv>0 & \mbox{ for } 0\leq v\leq v_0 \\ & m(v)=M_0 & \mbox{ for } v>v_0 \end{array}$

[Ashtekar & Krishnan, LRR 7, 10 (2004)]

not applicable in cosmology, for in general (*M*, *g*) is not asymptotically flat
 even when applicable, this definition is highly non-local:

 \Rightarrow no local physical experiment whatsoever can locate the event horizon

Black hole horizons

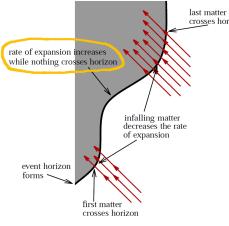

Another non-local feature: teleological nature of event horizons

The classical black hole boundary, i.e. the event horizon, responds in advance to what will happen in the future.

A D F A A F F

Another non-local feature: teleological nature of event horizons

[Booth, Can. J. Phys. 83, 1073 (2005)]

The classical black hole boundary, i.e. the event horizon, responds in advance to what will happen in the future.

To deal with black holes as ordinary physical objects, a **local** definition would be desirable

 \rightarrow quantum gravity, numerical relativity

Image: A match a ma

Local characterizations of black holes

New paradigm for the theoretical approach to black holes: instead of *event horizons*, black holes are described by

- trapping horizons (Hayward 1994)
- isolated horizons (Ashtekar et al. 1999)
- dynamical horizons (Ashtekar and Krishnan 2002)
- slowly evolving horizons (Booth and Fairhurst 2004)

All these concepts are **local** and are based on the notion of trapped surfaces

Image: A matrix and a matrix

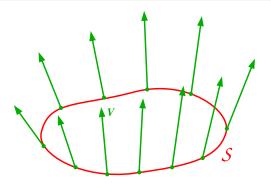

What is a trapped surface ? 1/ Expansion of a surface along a normal vector field

 Consider a spacelike 2-surface S (induced metric: q)

A ID > A ID > A

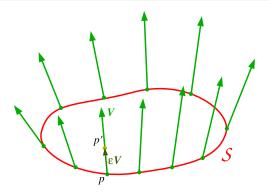

What is a trapped surface ? 1/ Expansion of a surface along a normal vector field

- Consider a spacelike 2-surface S (induced metric: q)
- Take a vector field v defined on S and normal to S at each point

Image: A mathematic states and a mathematic states

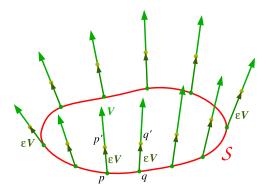

What is a trapped surface ? 1/ Expansion of a surface along a normal vector field

- Consider a spacelike 2-surface S (induced metric: q)
- Take a vector field v defined on S and normal to S at each point
- ε being a small parameter, displace the point p by the vector εv to the point p'

< □ > < ^[] >

What is a trapped surface ? 1/ Expansion of a surface along a normal vector field

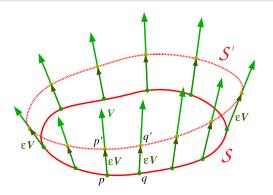

- Consider a spacelike 2-surface S (induced metric: q)
- Take a vector field v defined on S and normal to S at each point
- ε being a small parameter, displace the point p by the vector εv to the point p'

A D > A A

• Do the same for each point in S, keeping the value of ε fixed

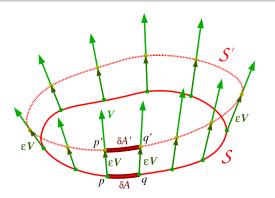

What is a trapped surface ? 1/ Expansion of a surface along a normal vector field

Link with apparent horizons

A closed spacelike 2-surface \mathscr{S} is said to be outer trapped (resp. marginally outer trapped (MOTS)) iff [Hawking & Ellis 1973]

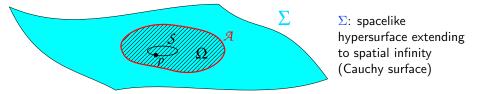

- the notions of *interior* and *exterior* of *S* can be defined (for instance spacetime asymptotically flat) ⇒ *l* is chosen to be the *outgoing* null normal and *k* to be the *ingoing* one
- $\theta^{(\ell)} < 0$ (resp. $\theta^{(\ell)} = 0$)

Link with apparent horizons

A closed spacelike 2-surface \mathscr{S} is said to be outer trapped (resp. marginally outer trapped (MOTS)) iff [Hawking & Ellis 1973]

the notions of *interior* and *exterior* of *S* can be defined (for instance spacetime asymptotically flat) ⇒ *l* is chosen to be the *outgoing* null normal and *k* to be the *ingoing* one

•
$$\theta^{(\ell)} < 0$$
 (resp. $\theta^{(\ell)} = 0$)

outer trapped region of Σ : Ω = set of points $p \in \Sigma$ through which there is a outer trapped surface \mathscr{S} lying in Σ

apparent horizon in Σ : \mathcal{A} = connected component of the boundary of Ω

Proposition [Hawking & Ellis 1973]: \mathcal{A} smooth $\Longrightarrow \mathcal{A}$ is a MOTS

Connection with singularities and black holes

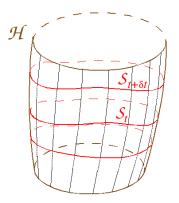

Proposition [Penrose (1965)]:

provided that the weak energy condition holds, \exists a trapped surface $\mathscr{S} \Longrightarrow \exists$ a singularity in (\mathscr{M}, g) (in the form of a future inextendible null geodesic)

Proposition [Hawking & Ellis (1973)]: provided that the cosmic censorship conjecture holds, \exists a trapped surface $\mathscr{S} \Longrightarrow \exists$ a black hole \mathscr{B} and $\mathscr{S} \subset \mathscr{B}$

Local definitions of "black holes"

A hypersurface $\mathcal H$ of $(\mathscr M, \boldsymbol{g})$ is said to be

• a future outer trapping horizon (FOTH) iff

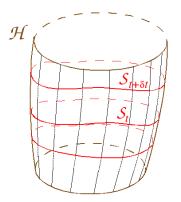

(i) \mathcal{H} foliated by marginally trapped 2-surfaces ($\theta^{(k)} < 0$ and $\theta^{(\ell)} = 0$) (ii) $\mathcal{L}_k \theta^{(\ell)} < 0$ (locally outermost trapped surf.)

Known black holes

Three kinds of black holes are known in the Universe:

• Stellar black holes: supernova remnants: $M \sim 10 - 30 \ M_{\odot}$ and $R \sim 30 - 90 \ \text{km}$ example: Cyg X-1 : $M = 15 \ M_{\odot}$ and $R = 45 \ \text{km}$

Can we see a black hole from the Earth ?

Angular diameter of the event horizon of a Schwarzschild BH of mass *M* seen from a distance *d*:

$$\Theta = 6\sqrt{3}\,\frac{GM}{c^2d} \simeq 2.60\frac{2R_{\rm S}}{d}$$

Image of a thin accretion disk around a Schwarzschild BH

[Vincent, Paumard, Gourgoulhon & Perrin, CQG 28, 225011 (2011)]

< □ > < 🗗 > < 🖹

Can we see a black hole from the Earth ?

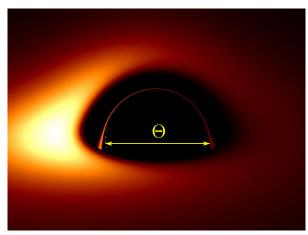

Image of a thin accretion disk around a Schwarzschild BH [Vincent, Paumard, Gourgoulhon & Perrin, CQG 28, 225011 (2011)] Angular diameter of the event horizon of a Schwarzschild BH of mass M seen from a distance d:

$$\Theta = 6\sqrt{3}\,\frac{GM}{c^2 d} \simeq 2.60\frac{2R_{\rm S}}{d}$$

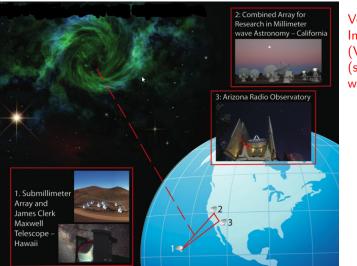

Largest black holes in the Earth's sky:

Sgr A* : $\Theta = 53 \ \mu as$ **M87** : $\Theta = 21 \ \mu as$ **M31** : $\Theta = 20 \ \mu as$

Image: A match a ma

Remark: black holes in X-ray binaries are $\sim 10^5$ times smaller, for $\Theta \propto M/d$

The solution to reach the μas regime: interferometry !

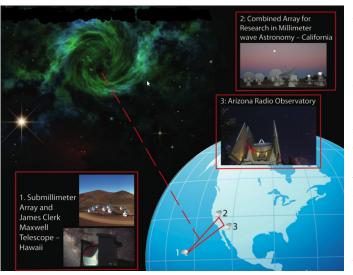

Existing American VLBI network [Doeleman et al. 2011]

Very Large Baseline Interferometry (VLBI) in (sub)millimeter waves

Éric Gourgoulhon (LUTH)

The solution to reach the μas regime: interferometry !

Very Large Baseline Interferometry (VLBI) in (sub)millimeter waves

The best result so far: VLBI observations at 1.3 mm have shown that the size of the emitting region in Sgr A* is only $37 \ \mu as$ [Doeleman et al., Nature

[Doeleman et al., Nature **455**, 78 (2008)]

Existing American VLBI network [Doeleman et al. 2011]

The near future: the Event Horizon Telescope

To go further:

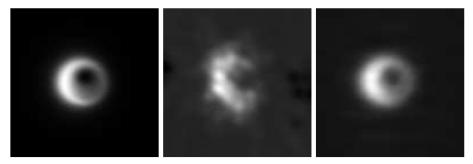

- \bullet shorten the wavelength: $1.3\;mm \rightarrow 0.8\;mm$
- increase the number of stations; in particular add ALMA

Atacama Large Millimeter Array (ALMA) part of the Event Horizon Telescope (EHT) to be completed by 2020

< 17 ▶

The near future: the Event Horizon Telescope

Simulations of VLBI observations of Sgr A* at $\lambda = 0.8 \text{ mm}$ left: perfect image, centre: 7 stations (~ 2015), right: 13 stations (~ 2020) $a = 0, i = 30^{\circ}$

[Fish & Doeleman, Proc. IAU Symp 261 (2010)]

Near-infrared optical interferometry: GRAVITY

[Gillessen et al. 2010]

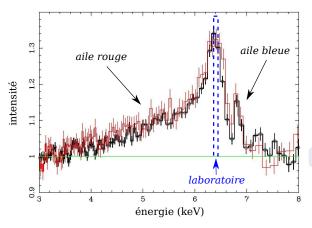

GRAVITY instrument at VLTI (2015)

Beam combiner (the four 8 m telescopes + four auxiliary telescopes) \implies astrometric precision of 10 μ as

• • • • • • • •

X-ray observations (Athena)

The accretion disk as a spacetime probe

 $\mathbf{K}\alpha$ line: X fluorescence line of Fe atoms in the accretion disk (the Fe atoms are excited by the X-ray emitted from the plasma corona surrounding the disk)

 $\mathsf{Redshift} \Rightarrow \mathsf{time\ dilatation}$

Athena scientific theme selected for ESA L2 mission

< □ > < ^[] >

 $K\alpha$ line in the nucleus of the galaxy MCG-6-30-15 observed by XMM-Newton (red) and Suzaku (black) (adapted from [Miller (2007)])

Another way to "see" BHs: gravitational waves

Link between black holes and gravitational waves: Black holes and gravitational waves are both spacetime distortions:

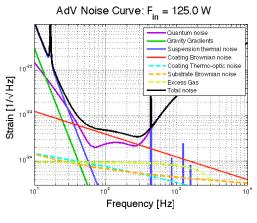

- extreme distortions (black holes)
- small distortions (gravitational waves)

Image: A math a math

In particular, black holes and gravitational waves are both vacuum solutions of general relativity equations (Einstein equations)

Advanced VIRGO

Advanced VIRGO: dual recycled (power + signal) interferometer with laser power \sim 125 W

[[]CNRS/INFN/NIKHEF]

- VIRGO+ decommissioned in Nov. 2011
- Construction of Advanced VIRGO underway
- First lock in 2015

< □ > < 🗗 > < 🖹

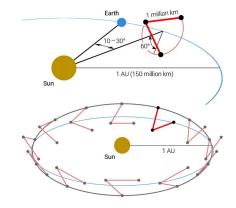

- $\bullet~{\rm Sensitivity} \sim$ 10 $\times~{\rm VIRGO}$
- \implies explored Universe volume 10^3 times larger !

eLISA

Gravitational wave detector in space \implies low frequency range: $[10^{-3}, 10^{-1}]$ Hz

[http://www.elisascience.org/]

- eLISA scientific theme selected in Nov. 2013 for ESA L3 mission \implies launch in 2028
- LISA Pathfinder to be launched in 2015

Éric Gourgoulhon (LUTH)
