# Another non-local feature: teleological nature of event horizons

The classical black hole boundary, i.e. the event horizon, responds in advance to what will happen in the future.

[Booth, Can. J. Phys. 83, 1073 (2005)]

#### To deal with black holes as physical objects, a local definition would be desirable

Eric Gourgoulhon and José Luis Jaramillo (LUTH)

#### Local characterizations of black holes

Recently a **new paradigm** appeared in the theoretical approach of black holes: instead of event horizon, black holes are described by

- trapping horizons (Hayward 1994)
- isolated horizons (Ashtekar et al. 1999)
- dynamical horizons (Ashtekar and Krishnan 2002)

All these concepts are **local** and are based on the notion of trapped surfaces

Motivations: quantum gravity, numerical relativity

#### Trapped surfaces

 $\mathcal S$  : closed (i.e. compact without boundary) spacelike 2-dimensional surface embedded in spacetime  $(\mathscr M,g)$ 

 $\exists \text{ two future-directed null directions} \\ (\text{light rays}) \text{ orthogonal to } S: \\ \ell = \text{ outgoing, expansion } \theta^{(\ell)} \\ k = \text{ ingoing, expansion } \theta^{(k)} \\ \text{ In flat space, } \theta^{(k)} < 0 \text{ and } \theta^{(\ell)} > 0 \end{cases}$ 

Image: A math a math

• S is trapped  $\iff \theta^{(k)} \le 0$  and  $\theta^{(\ell)} \le 0$ • S is marginally trapped  $\iff \theta^{(k)} \le 0$  and  $\theta^{(\ell)} = 0$ 

#### Trapped surfaces

 $\mathcal S$  : closed (i.e. compact without boundary) spacelike 2-dimensional surface embedded in spacetime  $(\mathscr M,g)$ 

 $\exists \text{ two future-directed null directions} \\ (\text{light rays}) \text{ orthogonal to } \mathcal{S}: \\ \ell = \text{outgoing, expansion } \theta^{(\ell)} \\ k = \text{ingoing, expansion } \theta^{(k)} \\ \text{In flat space, } \theta^{(k)} < 0 \text{ and } \theta^{(\ell)} > 0 \\ \end{cases}$ 

• S is trapped  $\iff \theta^{(k)} \le 0$  and  $\theta^{(\ell)} \le 0$ • S is marginally trapped  $\iff \theta^{(k)} \le 0$  and  $\theta^{(\ell)} = 0$ 

trapped surface = local concept characterizing very strong gravitational fields

## Connection with singularities and black holes

*Proposition* [Penrose (1965)]: provided that the weak energy condition holds,  $\exists$  a trapped surface  $S \Longrightarrow \exists$  a singularity in  $(\mathcal{M}, g)$  (in the form of a future inextendible null geodesic)

*Proposition* [Hawking & Ellis (1973)]: provided that the cosmic censorship conjecture holds,  $\exists$  a trapped surface  $S \Longrightarrow \exists$  a black hole  $\mathcal{B}$  and  $S \subset \mathcal{B}$ 

New horizons

A hypersurface  $\mathcal H$  of  $(\mathscr M, \boldsymbol{g})$  is said to be

(i)  $\mathcal{H}$  foliated by marginally trapped 2-surfaces  $(\theta^{(k)} < 0 \text{ and } \theta^{(\ell)} = 0)$ (ii)  $\mathcal{L}_{k} \theta^{(\ell)} < 0$ 

[Hayward, PRD 49, 6467 (1994)]

New horizons

A hypersurface  $\mathcal H$  of  $(\mathscr M, \boldsymbol{g})$  is said to be

• a future outer trapping horizon (FOTH) iff

(i)  $\mathcal{H}$  foliated by marginally trapped 2-surfaces  $(\theta^{(k)} < 0 \text{ and } \theta^{(\ell)} = 0)$ (ii)  $\mathcal{L}_{k} \theta^{(\ell)} < 0$ 

[Hayward, PRD 49, 6467 (1994)]

• a dynamical horizon iff

(i)  $\mathcal{H}$  is foliated by marginally trapped 2-surfaces (ii)  $\mathcal{H}$  is spacelike

[Ashtekar & Krishnan, PRL 89 261101 (2002)]

New horizons

A hypersurface  $\mathcal H$  of  $(\mathscr M, \boldsymbol{g})$  is said to be

• a future outer trapping horizon (FOTH) iff

(i)  $\mathcal{H}$  foliated by marginally trapped 2-surfaces ( $\theta^{(k)} < 0$  and  $\theta^{(\ell)} = 0$ ) (ii)  $\mathcal{L}_{k} \theta^{(\ell)} < 0$ 

[Hayward, PRD 49, 6467 (1994)]

#### • a dynamical horizon iff

(i)  ${\cal H}$  is foliated by marginally trapped 2-surfaces (ii)  ${\cal H}$  is spacelike

[Ashtekar & Krishnan, PRL 89 261101 (2002)]

- a non-expanding horizon iff
  - (i)  $\mathcal{H}$  is null (null normal  $\ell$ ) (ii)  $\theta^{(\ell)} = 0$  [Hájiček (1973)]

New horizons

A hypersurface  $\mathcal H$  of  $(\mathscr M, \boldsymbol{g})$  is said to be

• a future outer trapping horizon (FOTH) iff

(i)  $\mathcal{H}$  foliated by marginally trapped 2-surfaces  $(\theta^{(k)} < 0 \text{ and } \theta^{(\ell)} = 0)$ (ii)  $\mathcal{L}_{k} \theta^{(\ell)} < 0$ 

[Hayward, PRD 49, 6467 (1994)]

#### • a dynamical horizon iff

(i)  ${\cal H}$  is foliated by marginally trapped 2-surfaces (ii)  ${\cal H}$  is spacelike

[Ashtekar & Krishnan, PRL 89 261101 (2002)]

#### • a non-expanding horizon iff

- (i)  $\mathcal{H}$  is null (null normal  $\ell$ )
- (ii)  $\theta^{(\ell)} = 0$  [Hájiček (1973)]
- an isolated horizon iff
  - (i)  $\mathcal{H}$  is a non-expanding horizon

(ii)  $\mathcal{H}$ 's full geometry is not evolving along the null generators:  $[\mathcal{L}_{\ell}, \hat{\nabla}] = 0$ 

[Ashtekar, Beetle & Fairhurst, CQG 16, L1 (1999)]

## Dynamics of these new horizons

The *dynamical horizons* and *trapping horizons* have their **own dynamics**, ruled by the Einstein equation.

In particular, one can establish for them

- first and second laws of black hole mechanics [Ashtekar & Krishnan, PRD 68, 104030 (2003)], [Hayward, PRD 70, 104027 (2004)]
- a Navier-Stokes like equation ⇒ viscous membrane behavior as for the event horizon ("membrane paradigm") [Gourgoulhon, PRD 72, 104007 (2005)]

## Concept of black hole viscosity

- Hartle and Hawking (1972, 1973): introduced the concept of **black hole viscosity** when studying the response of the *event horizon* to external perturbations
- Damour (1979): 2-dimensional **Navier-Stokes** like equation for the event horizon  $\implies$  shear viscosity and bulk viscosity
- Thorne and Price (1986): membrane paradigm for black holes

## Concept of black hole viscosity

- Hartle and Hawking (1972, 1973): introduced the concept of **black hole viscosity** when studying the response of the *event horizon* to external perturbations
- Damour (1979): 2-dimensional **Navier-Stokes** like equation for the event horizon  $\implies$  shear viscosity and bulk viscosity
- Thorne and Price (1986): membrane paradigm for black holes

Shall we restrict the analysis to the event horizon ?

Can we extend the concept of viscosity to the local characterizations of black hole recently introduced, i.e. future outer trapping horizons and dynamical horizons ?

NB: *event horizon* = null hypersurface *future outer trapping horizon* = null or spacelike hypersurface *dynamical horizon* = spacelike hypersurface

A D N A P N A P N

#### Navier-Stokes equation in Newtonian fluid dynamics

$$\rho\left(\frac{\partial v^i}{\partial t} + v^j \nabla_j v^i\right) = -\nabla^i P + \mu \Delta v^i + \left(\zeta + \frac{\mu}{3}\right) \nabla^i (\nabla_j v^j) + f^i$$

or, in terms of fluid momentum density  $\pi_i := \rho v_i$ ,

$$\frac{\partial \pi_i}{\partial t} + v^j \nabla_j \pi_i + \theta \pi_i = -\nabla_i P + 2\mu \nabla^j \sigma_{ij} + \zeta \nabla_i \theta + f_i$$

where  $\theta$  is the fluid expansion:

$$\theta := \nabla_j v^j$$

and  $\sigma_{ij}$  the velocity shear tensor:

$$\sigma_{ij} := \frac{1}{2} \left( \nabla_i v_j + \nabla_j v_i \right) - \frac{1}{3} \theta \, \delta_{ij}$$

P is the pressure,  $\mu$  the shear viscosity,  $\zeta$  the bulk viscosity and  $f_i$  the density of external forces

#### Evolution vector on the horizon

Vector field h on  $\mathcal H$  defined by

- (i) h is tangent to  ${\cal H}$
- (ii) h is orthogonal to  $S_t$
- (iii)  $\mathcal{L}_{h} t = h^{\mu} \partial_{\mu} t = \langle \mathbf{d} t, \mathbf{h} \rangle = 1$

NB: (iii)  $\implies$  the 2-surfaces  $S_t$  are Lie-dragged by h

Image: A matrix

#### Generalized Damour-Navier-Stokes equation

For a future trapping horizon, one can derive from Einstein equation the following relation [Gourgoulhon, PRD 72, 104007 (2005)]

$${}^{\mathcal{S}}\mathcal{L}_{h}\,\boldsymbol{\Omega}^{(\ell)} + \theta^{(h)}\,\boldsymbol{\Omega}^{(\ell)} = \boldsymbol{\mathcal{D}}\boldsymbol{\kappa} - \boldsymbol{\mathcal{D}}\cdot\vec{\boldsymbol{\sigma}}^{(m)} - \frac{1}{2}\boldsymbol{\mathcal{D}}\theta^{(h)} - \theta^{(k)}\boldsymbol{\mathcal{D}}\boldsymbol{C} + 8\pi\vec{\boldsymbol{q}}^{*}\boldsymbol{T}\cdot\boldsymbol{m}$$

- $\Omega^{(\ell)}$  : normal fundamental form of  $\mathcal{S}_t$  associated with null normal  $\ell$
- $\theta^{(h)}, \, \theta^{(m)}$  and  $\theta^{(k)}$ : expansion scalars of  $\mathcal{S}_t$  along the vectors  $h, \, m$  and k
- $\mathcal{D}$  : covariant derivative within  $(\mathcal{S}_t, q)$
- $\kappa = -\mathbf{k} \cdot \nabla_{\mathbf{h}} \mathbf{h}$  : "surface-gravity"
- $\sigma^{(m)}$  : shear tensor of  $\mathcal{S}_t$  along the vector m
- C : half the scalar square of h

# Equivalent form

Similar to the Navier-Stokes-like equation obtained by Damour (1978) for an event horizon, except for the positive bulk viscosity.

### Generalized angular momentum

Definition [Booth & Fairhurst, CQG 22, 4545 (2005)]: Let  $\varphi$  be a vector field on  $\mathcal H$  which

- $\bullet$  is tangent to  $\mathcal{S}_t$
- has closed orbits
- ullet has vanishing divergence with respect to the induced metric:  ${\cal D}\cdot \varphi=0$

The generalized angular momentum associated with arphi is then defined by

$$J(oldsymbol{arphi}) := -rac{1}{8\pi} \oint_{\mathcal{S}_t} \langle oldsymbol{\Omega}^{(oldsymbol{\ell})}, oldsymbol{arphi} 
angle^{\,arsigma} \epsilon,$$

*Remark 1:* does not depend upon the choice of null vector  $\ell$ , thanks to the divergence-free property of  $\varphi$ *Remark 2:* 

- coincides with Ashtekar & Krishnan's definition for a dynamical horizon
- $\bullet$  coincides with Brown-York angular momentum if  ${\mathcal H}$  is timelike and  $\varphi$  a Killing vector

#### Angular momentum flux law

Under the supplementary hypothesis that  $\varphi$  is transported along the evolution vector h :  $\mathcal{L}_h \varphi = 0$ , the generalized Damour-Navier-Stokes equation leads to

$$\frac{d}{dt}J(\boldsymbol{\varphi}) = -\oint_{\mathcal{S}_t} \boldsymbol{T}(\boldsymbol{m},\boldsymbol{\varphi})^{s} \boldsymbol{\epsilon} - \frac{1}{16\pi} \oint_{\mathcal{S}_t} \left[\vec{\boldsymbol{\sigma}}^{(\boldsymbol{m})} : \mathcal{L}_{\boldsymbol{\varphi}} \boldsymbol{q} - 2\theta^{(\boldsymbol{k})} \boldsymbol{\varphi} \cdot \boldsymbol{\mathcal{D}}C\right]^{s} \boldsymbol{\epsilon}$$

## Outline

2 A Navier-Stokes-like equation

Applications to numerical relativity

#### 3+1 numerical relativity

**3+1 formalism:** slicing of the spacetime manifold  $\mathscr{M}$  by a family of spacelike hypersurfaces  $(\Sigma_t)_{t \in \mathbb{R}}$ 

t = coordinate time $\Sigma_t =$  "the 3-dimensional space" at instant t

Applications to numerical relativity

#### 3+1 numerical relativity

**3+1 formalism:** slicing of the spacetime manifold  $\mathscr{M}$  by a family of spacelike hypersurfaces  $(\Sigma_t)_{t \in \mathbb{R}}$ 

$$\begin{split} & \sum_{t+dt} t = \text{coordinate time} \\ & \sum_{t} \sum_{t} \text{ (the 3-dimensional space) at instant } t \end{split}$$

 $\Rightarrow$  resolution of Einstein equation = Cauchy problem i.e. time evolution from initial data given on some hypersurface  $\Sigma_0$ 

Eric Gourgoulhon and José Luis Jaramillo (LUTH)

### 3+1 numerical relativity and black holes

#### black hole $\Rightarrow \exists$ singularity in spacetime $\Rightarrow$ divergent quantities in the 3+1 formalism

However, there is no need to numerically evolve the region around the singularity since it is hidden behind the event horizon and causally disconnected from the exterior.

• • • • • • • • • • •

Applications to numerical relativity

#### 3+1 numerical relativity and black holes

**black hole**  $\Rightarrow \exists$  singularity in spacetime  $\Rightarrow$  divergent quantities in the 3+1 formalism However, there is no need to numerically evolve the region around the singularity since it is hidden behind the event horizon and causally disconnected from the exterior.

Idea: excise from the numerical domain a region containing the singularity

Applications to numerical relativity

### 3+1 numerical relativity and black holes

**black hole**  $\Rightarrow \exists$  singularity in spacetime  $\Rightarrow$  divergent quantities in the 3+1 formalism However, there is no need to numerically evolve the region around the singularity since it is hidden behind the event horizon and causally disconnected from the exterior.

Idea: excise from the numerical domain a region containing the singularity

Provided that the excised region is located within the even horizon, the choice of it does not affect the exterior spacetime

Eric Gourgoulhon and José Luis Jaramillo (LUTH)

New theoretical perspectives on black holes

# Our project

Choose the excision boundary  $S_t$  to be a **marginally trapped surface** for each time t

The tube  $\mathcal{H} = \bigcup_{t \in \mathbb{R}} \mathcal{S}_t$ 

is then a trapping horizon

- geometrically well defined excision boundary
- ensures  $\mathcal{S}_t$  is located inside the event horizon  $\blacktriangleleft$
- easy to implement with spherical coordinates and spectral methods

- Equilibrium conditions (isolated horizon) expressed in terms of the quantities of the 3+1 formalism
  - [Jaramillo, Gourgoulhon & Mena Marugán, PRD 70, 124036 (2004)]
  - [Gourgoulhon & Jaramillo, Phys. Rep. 423, 159 (2006)]
- Analytical study of the dynamical case completed
- Numerical implementation has started in the framework of the constrained scheme for 3+1 Einstein equations (Dirac gauge)
  - [Bonazzola, Gourgoulhon, Grandclément & Novak, PRD 70, 104007 (2004)]
